**More about Memory**

# Is appending an array really so slow?

► `malloc()` vs. `realloc()`

# Is appending an array really so slow?

- ▶ If `realloc` doesn't copy:  $\Theta(1)$ .
- ▶ If `realloc` copies:  $\Theta(n)$ .
- ▶ Assume  $p$  is probability that `realloc` copies.
- ▶ **Expected time** is still<sup>1</sup>  $\Theta(n)$ .

---

<sup>1</sup>If  $p$  doesn't depend on  $n$ .

# How is empty memory found?

- Basically: a linked list.

# DSC 190

DATA STRUCTURES & ALGORITHMS

Lecture 2 | Part 2

**Dynamic Arrays**

# Motivation

- ▶ Can we have the best of both worlds?
- ▶  $\Theta(1)$  time access like an array.
- ▶  $\Theta(1)$  time append like a linked list.
- ▶ **Yes!** (sort of)

# The Idea

- ▶ Allocate memory for an **underlying array**.
  - ▶ say, 512 elements
  - ▶ This is the **physical size**.
- ▶ To append element, insert into first unused slot.
  - ▶ Number of elements used is the **logical size**.
  - ▶  $\Theta(1)$  time.

# The Idea

- ▶ We'll eventually run out of unused slots.
- ▶ Fix: allocate a new underlying array whose physical size is  $\gamma$  times as large.
  - ▶  $\gamma$  is the **growth factor**.
  - ▶ Commonly,  $\gamma = 2$ ; i.e., double its size.
  - ▶ Takes  $\Theta(k)$  time, where  $k$  is current size.

# Example

```
>>> arr = DynamicArray(initial_physical_size=4)
>>> arr.append(1)
>>> arr.append(2)
>>> arr.append(3)
>>> arr.append(4)
>>> arr.append(5)
```

Lecture 2 | Part 3

## Amortized Analysis

# Analysis

- ▶ Appending takes  $\Theta(1)$  time *usually*...
- ▶ ...but takes  $\Theta(k)$  time when we run out of slots.
  - ▶ Where  $k$  is current size of sequence.

# The Key

- ▶ Resizing is expensive, but rare.
  - ▶ If  $\gamma = 2$ , each new resize is twice as expensive, but happens half as often.
- ▶ Thus, the **cost per append** is small.
- ▶ **Amortize** the cost over all previous appends.

# Amortized Time Complexity

- ▶ The **amortized** time for an append is:

$$T_{\text{amort}}(n) = \frac{\text{total time for } n \text{ appends}}{n}$$

- ▶ We'll see that  $T_{\text{amort}}(n) = \Theta(1)$ .

# Amortized Analysis

total time for  $n$  appends  
=  
total time for **non-growing** appends  
+  
total time for **growing** appends

# Counting Growing Appends

- ▶ Want to calculate time taken by growing appends.
- ▶ First: how many appends caused a resize?
  - ▶  $\beta$ : initial physical size
  - ▶  $\gamma$ : growth factor

# Counting Growing Appends

- ▶ Suppose initial physical size is  $\beta = 512$ , and  $\gamma = 2$
- ▶ Resizes occur on append #:

512, 1024, 2048, 4096, ...

- ▶ In general, resizes occur on append #:

$\beta\gamma^0, \beta\gamma^1, \beta\gamma^2, \beta\gamma^3, \dots$

# Counting Growing Appends

- ▶ In a sequence of  $n$  appends, how many caused the physical size to grow?
- ▶ Simplification: Assume  $n$  is such that  $n$ th append caused a resize. Then, for some  $x \in \{0, 1, 2, \dots\}$ :

$$n = \beta \gamma^x$$

- ▶ If  $x = 0$  there was 1 resize; if  $x = 1$  there were 2; etc.

# Counting Growing Appends

- ▶ Solving for  $x$ :

$$x = \log_{\gamma} \frac{n}{\beta}$$

- ▶ Check: without assumption,  $x = \lfloor \log_{\gamma} \frac{n}{\beta} \rfloor$
- ▶ Number of resizes is  $\lfloor \log_{\gamma} \frac{n}{\beta} \rfloor + 1$

# Counting Growing Appends

- ▶ Number of resizes is  $\lfloor \log_{\gamma} \frac{n}{\beta} \rfloor + 1$
- ▶ Check with  $\gamma = 2, \beta = 512, n = 400$ 
  - ▶ Correct # of resizes: 0
- ▶ Check with  $\gamma = 2, \beta = 512, n = 1100$ 
  - ▶ Correct # of resizes: 2

# Time of Growing Appends

- ▶ How much time was taken across all appends that caused resizes?
- ▶ Assumption: resizing an array with physical size  $k$  takes time  $ck = \Theta(k)$ .
  - ▶  $c$  is a constant that depends on  $\gamma$ .

# Time of Growing Appends

- ▶ Time for first resize:  $c\beta$ .
- ▶ Time for second resize:  $c\gamma\beta$ .
- ▶ Time for third resize:  $c\gamma^2\beta$ .
- ▶ Time for  $j$ th resize:  $c\gamma^{j-1}\beta$ .
- ▶ This is a **geometric progression**.

# Time of Growing Appends

- ▶ Time for  $j$ th resize:  $c\gamma^{j-1}\beta$ .
- ▶ Suppose there are  $r$  resizes.
- ▶ Total time:

$$c\beta \sum_{j=1}^r \gamma^{j-1} = c\beta \sum_{j=0}^r \gamma^j$$

# Recall: Geometric Sum

- From some class you've taken:

$$\sum_{p=0}^N x^p = \frac{1 - x^{N+1}}{1 - x}$$

- Example:

$$1 + 2 + 4 + 8 + 16 = \sum_{p=0}^4 2^p = \frac{1 - 2^5}{1 - 2} = 31$$

# Time of Growing Appends

- Total time:

$$c\beta \sum_{j=0}^r \gamma^j = c\beta \frac{1 - \gamma^{r+1}}{1 - \gamma}$$

# Time of Growing Appends

- ▶ Remember: in  $n$  appends there are  $r = \lfloor \log_{\gamma} \frac{n}{\beta} \rfloor + 1$  resizes.
- ▶ Total time:

$$\begin{aligned} c\beta \frac{1 - \gamma^{r+1}}{1 - \gamma} &= c\beta \frac{1 - \gamma^{\lfloor \log_{\gamma} \frac{n}{\beta} \rfloor + 2}}{1 - \gamma} \\ &= \Theta(n) \end{aligned}$$

# Amortized Analysis

total time for  $n$  appends

=

total time for **non-growing** appends

+

$\Theta(n)$        $\leftarrow$  total time for **growing** appends

# Time of Non-Growing Appends

- ▶ In a sequence of  $n$  appends, how many are **non-growing**?

$$n - \left( \lfloor \log_{\gamma} \frac{n}{\beta} \rfloor + 1 \right) = \Theta(n)$$

- ▶ Time for one such append:  $\Theta(1)$ .
- ▶ Total time:  $\Theta(n) \times \Theta(1) = \Theta(n)$ .

# Amortized Analysis

total time for  $n$  appends

=

$\Theta(n)$        $\leftarrow$  total time for **non-growing** appends

+

$\Theta(n)$        $\leftarrow$  total time for **growing** appends

# Amortized Time Complexity

- The **amortized** time for an append is:

$$\begin{aligned} T_{\text{amort}}(n) &= \frac{\text{total time for } n \text{ appends}}{n} \\ &= \frac{\Theta(n)}{n} \\ &= \Theta(1) \end{aligned}$$

# Dynamic Array Time Complexities

- ▶ Retrieve  $k$ th element:  $\Theta(1)$
- ▶ Append/pop element at end:
  - ▶  $\Theta(1)$  best case
  - ▶  $\Theta(n)$  worst case (where  $n$  = current size)
  - ▶  $\Theta(1)$  amortized
- ▶ Insert/remove in middle:  $O(n)$ 
  - ▶ May or may not need resize, still  $O(n)$ !

# DSC 190

DATA STRUCTURES & ALGORITHMS

Lecture 2 | Part 4

**Practicalities**

# Advantages

- ▶ Great cache performance (it's an array).
- ▶ Fast access.
- ▶ Don't need to know size in advance of allocation.

# Downsides

- ▶ Wasted memory.
- ▶ Expensive deletion in middle.

# Implementations

- ▶ Python: `list`
- ▶ C++: `std::vector`
- ▶ Java: `ArrayList`

## Exercise

Why do we need `np.array`? Python's `list` is a dynamic array, isn't that better?

# In defense of `np.array`

- ▶ Memory savings are one reason.
- ▶ Bigger reason: using Python's `list` to store numbers does not have good **cache** performance.
